

IN THE CLAIMS

1. (once amended) An endshield for an electric motor, said end shield comprising:
a body; and
a capacitor cover integral with said body and extending radially outward from said body.

11. (once amended) An endshield in accordance with Claim 10 wherein said plurality of slots pointing in generally the same circumferential direction.

14. (once amended) An electric motor assembly comprising:
a motor housing;
a stator mounted in said housing and comprising a bore therethrough, said stator having at least one main winding and at least one auxiliary winding;
a rotor core rotatably mounted in said housing and extending through said stator bore;
a capacitor in series with said auxiliary winding; and
an endshield connected to said housing, said endshield comprising a body and at least one mounting ear extending from said body, said at least one mounting ear having a slot extending completely therethrough.

17. (once amended) An electric motor assembly in accordance with Claim 14 wherein said at least one mounting ear further comprising a front face, a back face, an opening extending therethrough, and a first side, said opening extending through said front face and said back face, said slot extending through said mounting ear from said opening through said first side.

18. (once amended) A method of mounting an electric motor assembly to a machine, the electric motor assembly including a motor housing, a capacitor having at least one terminal, and an endshield, the endshield including a body, said method comprising:
providing a capacitor cover integral with and extending from the endshield body; and
